

Optimizing Breeding Programs

Effect of Reproductive Technologies and Measurement

Armidale Animal Breeding Summer Course 2014

Decisions in breeding programs

Where to go?

breeding objective (which traits)

Who and what to measure?

performance, DNA test

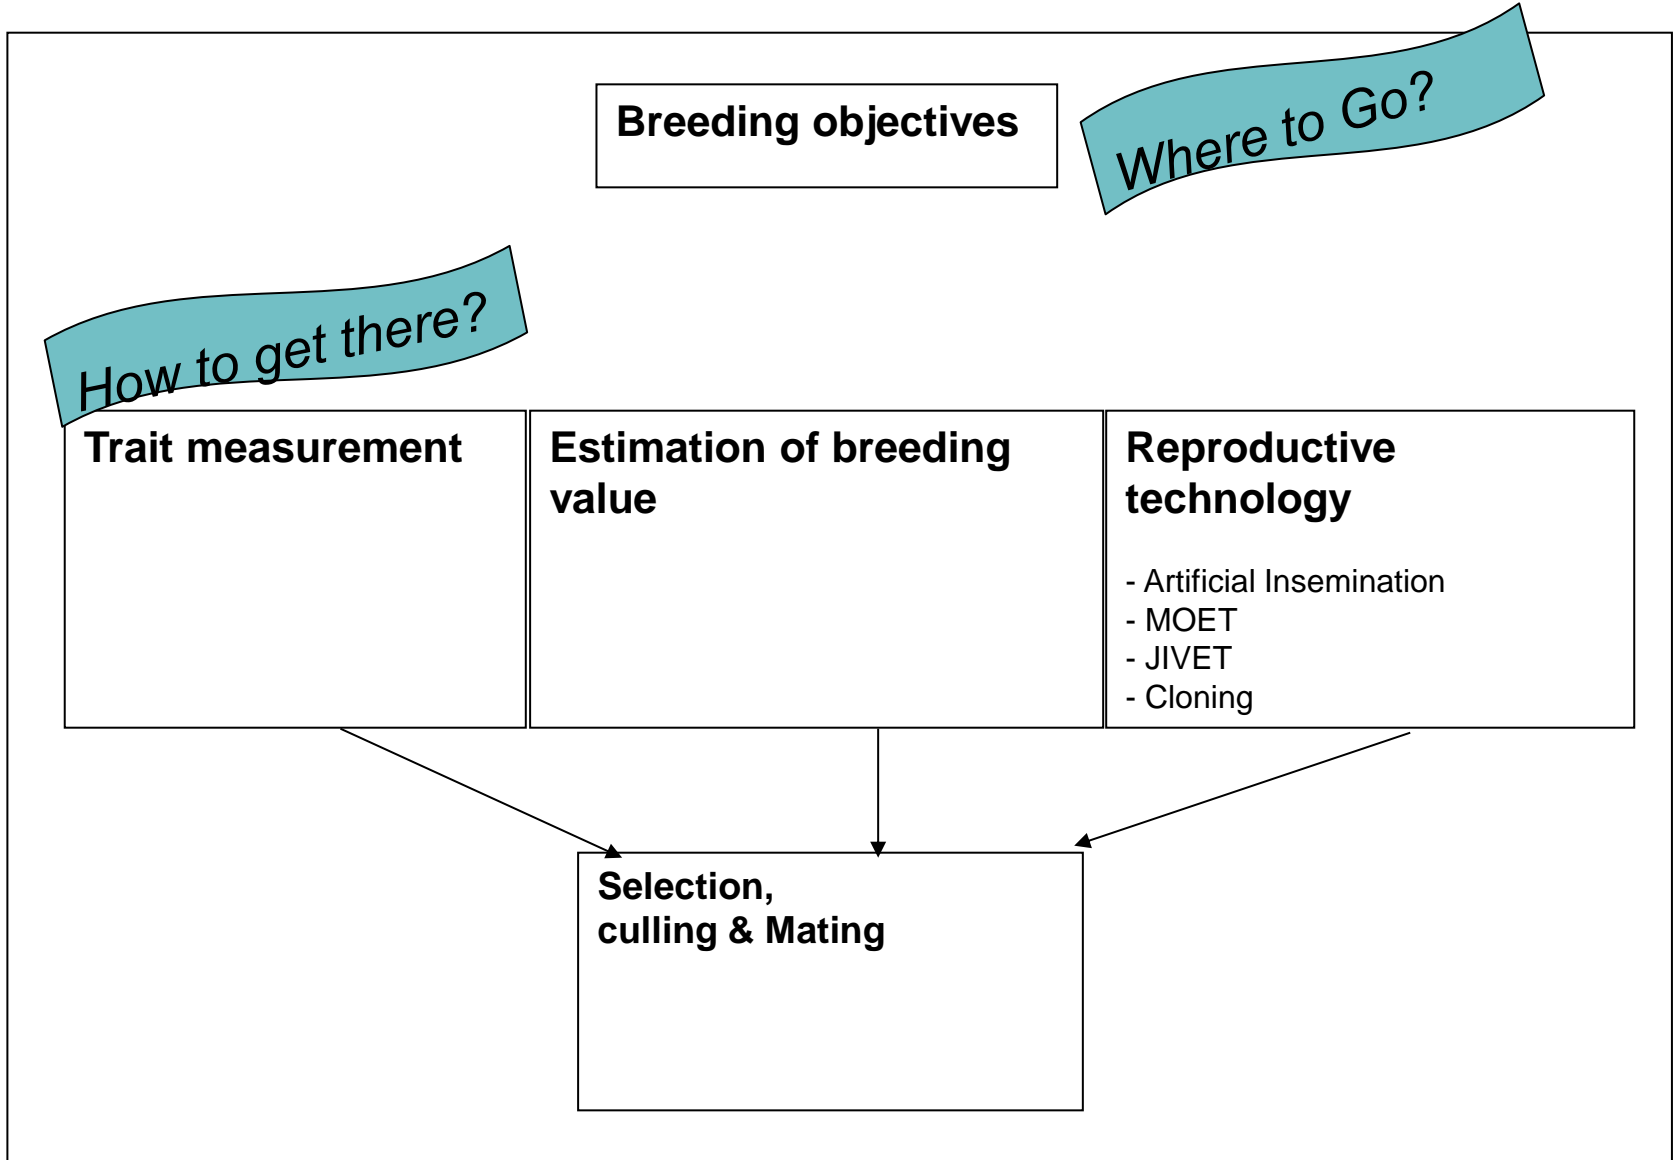

genetic evaluation

Who to select and mate?

reproductive technol.

gains vs inbreeding

Animal Breeding in a nutshell

Making genetic progress is about

Selecting only the very best

Selecting accurately

$$R = \frac{i_m r_m + i_f r_f}{L_m + L_f} \sigma_A$$

Keeping generation intervals short

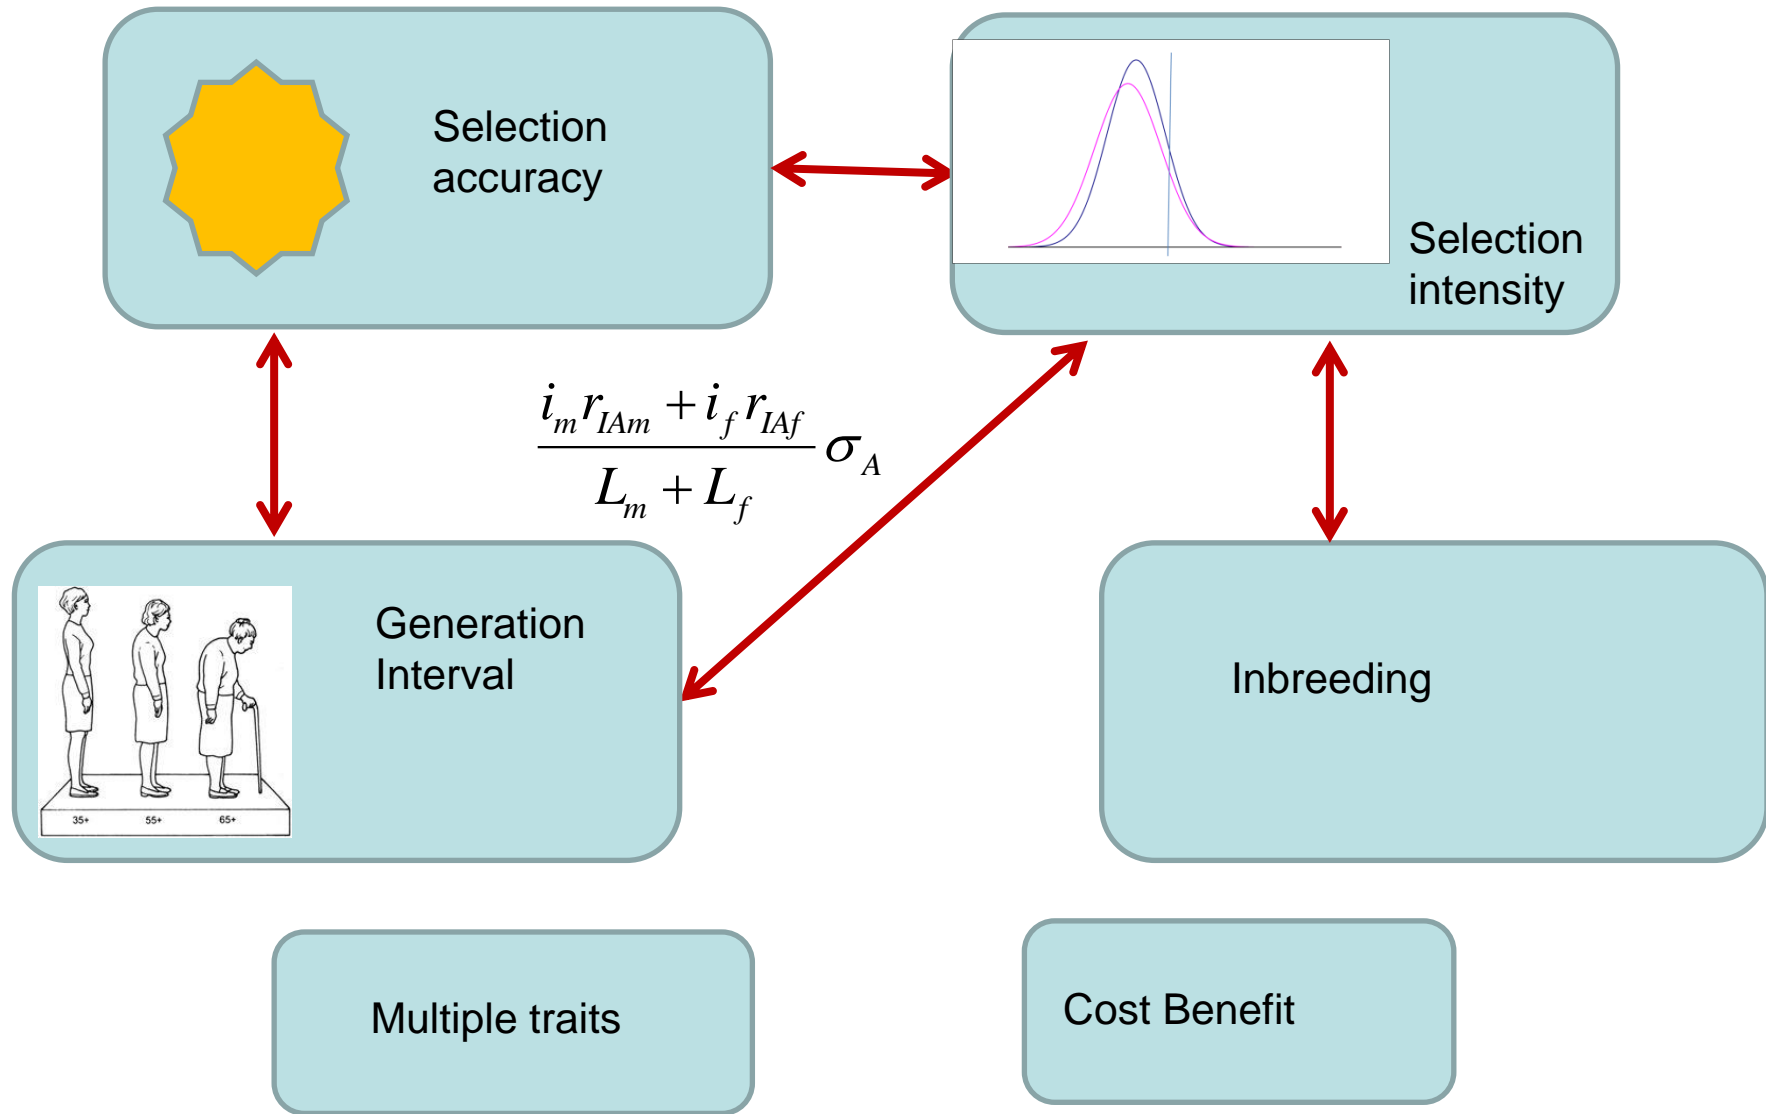

Reproductive rates affect all of the above!

Aspects that need to be balanced:

- Selection accuracy versus generation interval
 - Short generation intervals are good for fast progress, but young breeding animals have lower EBV accuracy
- Selection accuracy versus selection intensity
 - Money available for testing (either performance or DNA) can be used to test a few animals accurately, or to test more animals with lower accuracy. For example, testing fewer young bulls but giving them more test progeny.
- Selection intensity versus generation interval
 - Selecting fewer animals for breeding each year and keeping those longer
- Selection intensity versus inbreeding
- The relative emphasis in selection for multiple traits
- Cost versus benefits

$$\frac{i_m r_{IAm} + i_f r_{IAf}}{L_m + L_f} \sigma_A$$

Aspects that need to be balanced

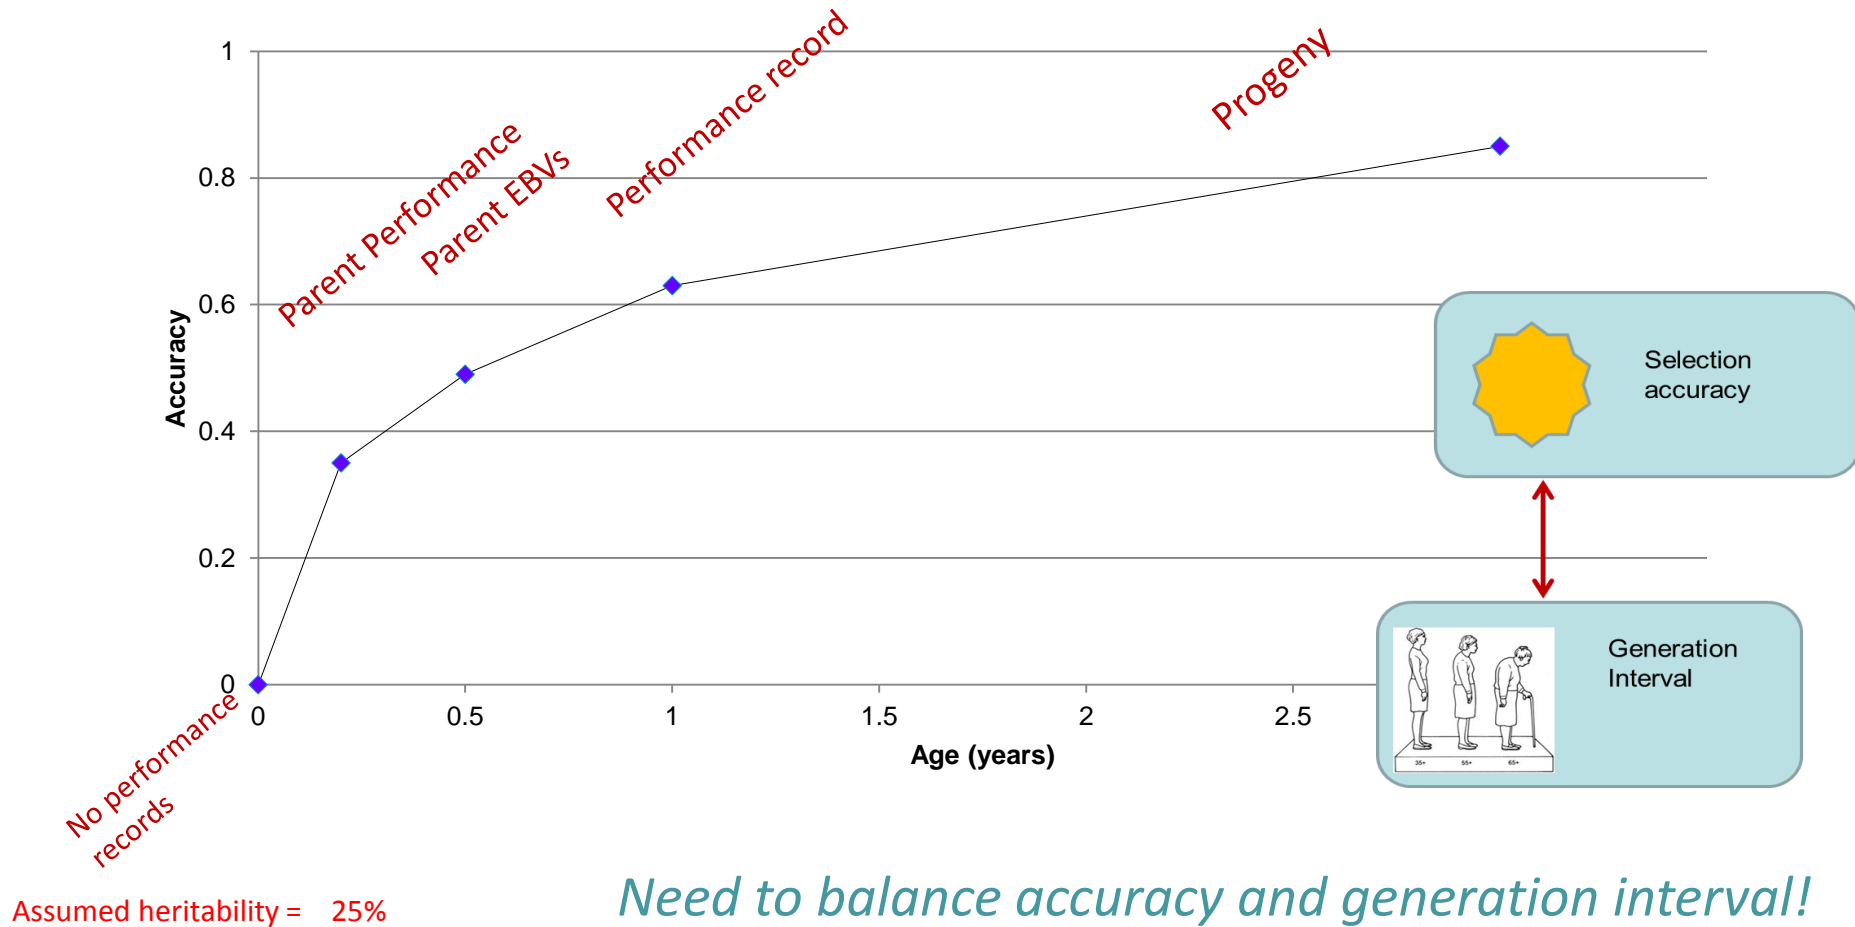

Accuracy = 45%

the more accuracy,
the more response

Accuracy of predicting a breeding value

- increases as an animal gets older

BLUP helps selecting between old and young bulls

- EBVs can be compared directly over age classes
- Selection on BLUP EBVs optimizes generation interval

Optimizing age structure

Accuracy changes with age class !

Without genomic selection

| ageclass | N in group | mean | SD | Nr Selected |
|----------|------------|-------|-----|-------------|
| 1 | 50 | 10.20 | 0.4 | 2.7 |
| 2 | 50 | 10.00 | 0.8 | 7.3 |

Accuracy

With genomic selection

| ageclass | N in group | mean | SD | Nr Selected |
|----------|------------|-------|-----|-------------|
| 1 | 50 | 10.20 | 0.7 | 5.4 |
| 2 | 50 | 10.00 | 0.8 | 4.6 |

Open nucleus systems

- Select the best animals from lower tiers to compete for being nucleus parents
- degree of 'openness depends on
 - difference between nucleus and commercial
 - spread of their breeding values
- Open to nuclei

Design Examples

Two-tier breeding program

Central Nucleus

(pigs, poultry, some dairy)

or Dispersed

(sheep, cattle)

Dispersed Nucleus

Nucleus: could be defined as

“the mothers and fathers of the future bulls”

Top studs

Delivering the genetics of
the future bulls

Other studs

Acquire their genetic
from top studs
Themselves being
merely multipliers

Open Nucleus

Open Nucleus

Best to select on EBV, irrespective of accuracy /genotyped or not / age

| | birth year | genotyped | progeny | EBV | acc |
|---------|------------|-----------|---------|------|-----|
| Kevin | 2009 | Y | 0 | +124 | 71 |
| Tony | 2005 | N | 345 | +119 | 97 |
| Bob | 2009 | N | 0 | +117 | 63 |
| John | 2008 | N | 45 | +113 | 85 |
| Paul | 2006 | N | 1087 | +112 | 99 |
| Geoff | 2009 | Y | 0 | +106 | 40 |
| Malcolm | 2007 | N | 67 | +105 | 89 |

Example of BLUP selection

inbreeding

These are sibs so might not select all of them as flock sire

Balancing inbreeding and merit

This graph will look different for each population

inbreeding or co-ancestry

une

Selection for milk Yield and Fertility

Multiple traits

| | <i>economic</i> | <i>weights</i> | <i>progeny</i> | <i>measured</i> | <i>response</i> | <i>(4 yrs)</i> |
|-------|-----------------|------------------|----------------|------------------|-----------------|------------------|
| | <i>milk</i> | <i>fertility</i> | <i>milk</i> | <i>fertility</i> | <i>milk</i> | <i>fertility</i> |
| left | 0.2 | 3 | 50 | 10 | 391 | -1.61 |
| right | 0.2 | 3 | 50 | 50 | 387 | -1.09 |

Effect of Reproductive Technologies

Making genetic progress is about

Selecting only the very best

Selecting accurately

$$R = \frac{i_m r_m + i_f r_f}{L_m + L_f} \sigma_A$$

Keeping generation intervals short

Reproductive rates affect all of the above!

Reproductive technologies

- Reproductive boosting
 - Artificial insemination, AI
 - Multiple Ovulation and Embryo Transfer, MOET
 - Oocyte Pickup
 - Juvenile In Vitro Embryo Transfer, JIVET
- Sexing of semen and embryos
- Cloning
- Whizzy Genetics - breeding in a test-tube

Reproductive (boosting) technologies

- Increases selection intensities
- Increases accuracy of EBVs
- Decreases generation intervals
- Increases inbreeding

Artificial Insemination

- More intensive use of best sires
- Use of overseas bulls
- Establish links between herds
- Progeny testing
- More rapid dissemination of superior genes

Multiple Ovulation and Embryo Transfer - MOET

- More intensive use of best cows
 - *“turns a cow into a sow”*
- Use of overseas cows

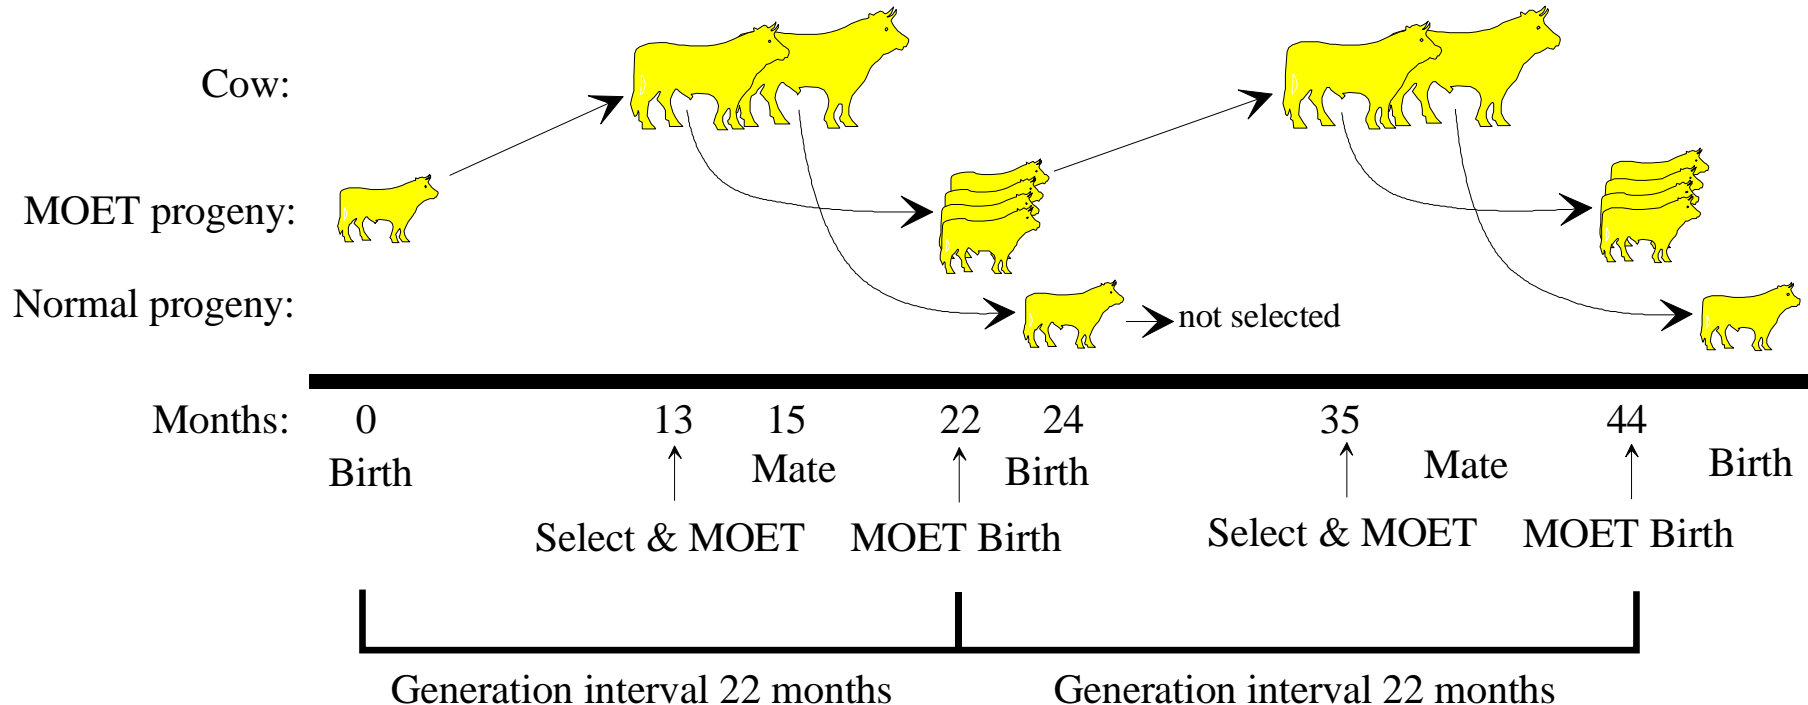

Adult dairy MOET scheme

More offspring of top cow *after* testing it

Juvenile dairy MOET scheme

More offspring of top cow *before* testing it
Select base on parent average

Genetic gain versus genetic diversity

- Early selection can only be based on family information
- Sustainable breeding programs require optimal selection balancing genetic gain and genetic diversity
- Potential short term benefits from reproductive technologies are inhibited by the need to maintain diversity

Genetic Gain vs Inbreeding After 20 Years

Tom Granleese et al., AAABG 2013

Between versus within family selection

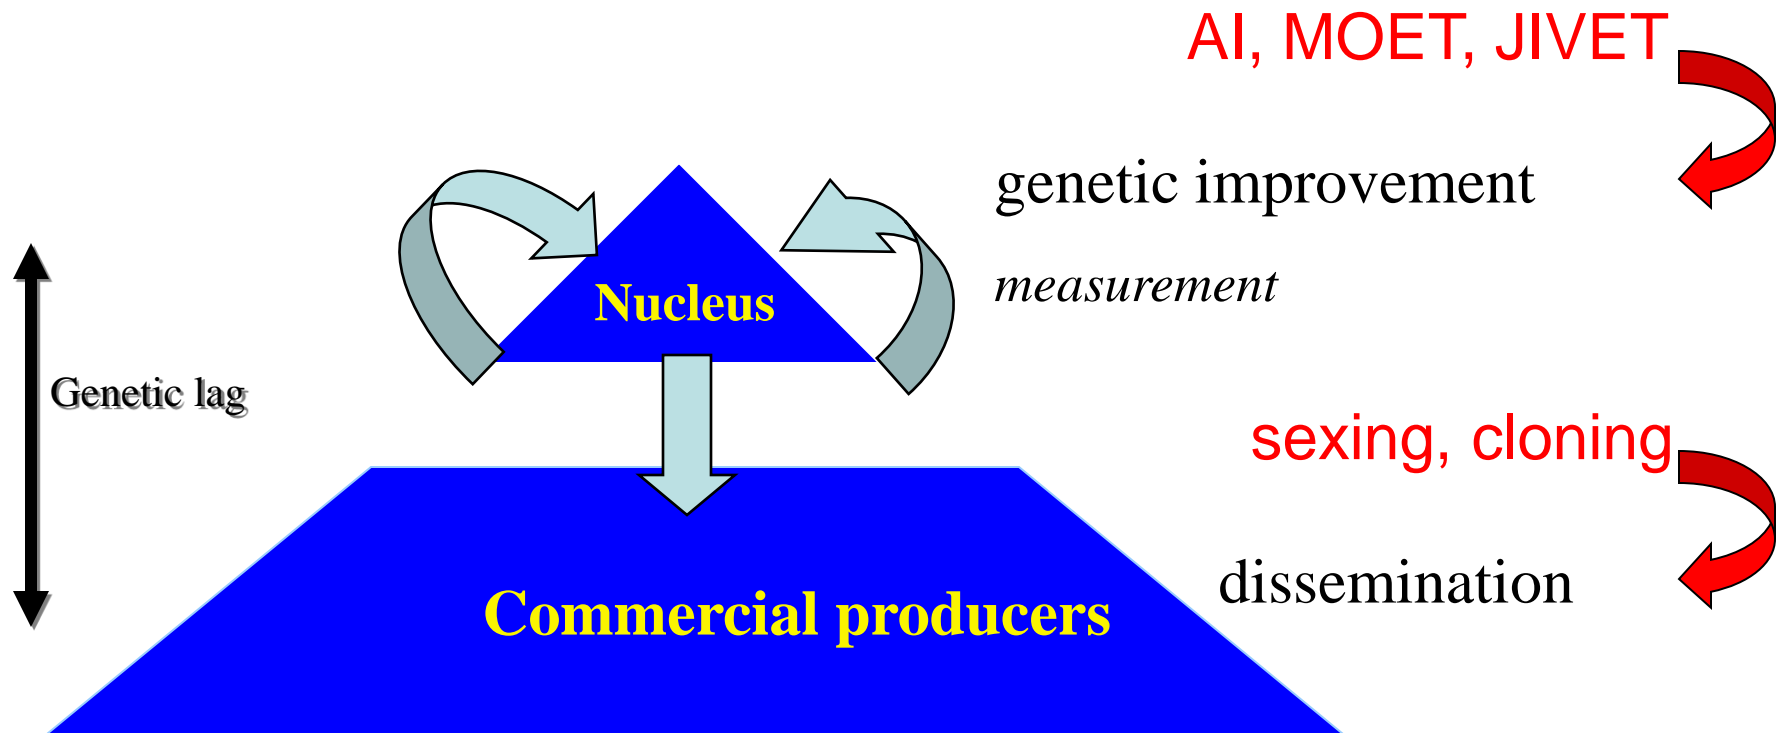

Own information (performance or *genotype*):

More variation within families

More within-family selection – ***less inbreeding***

Advantage of
genomic selection

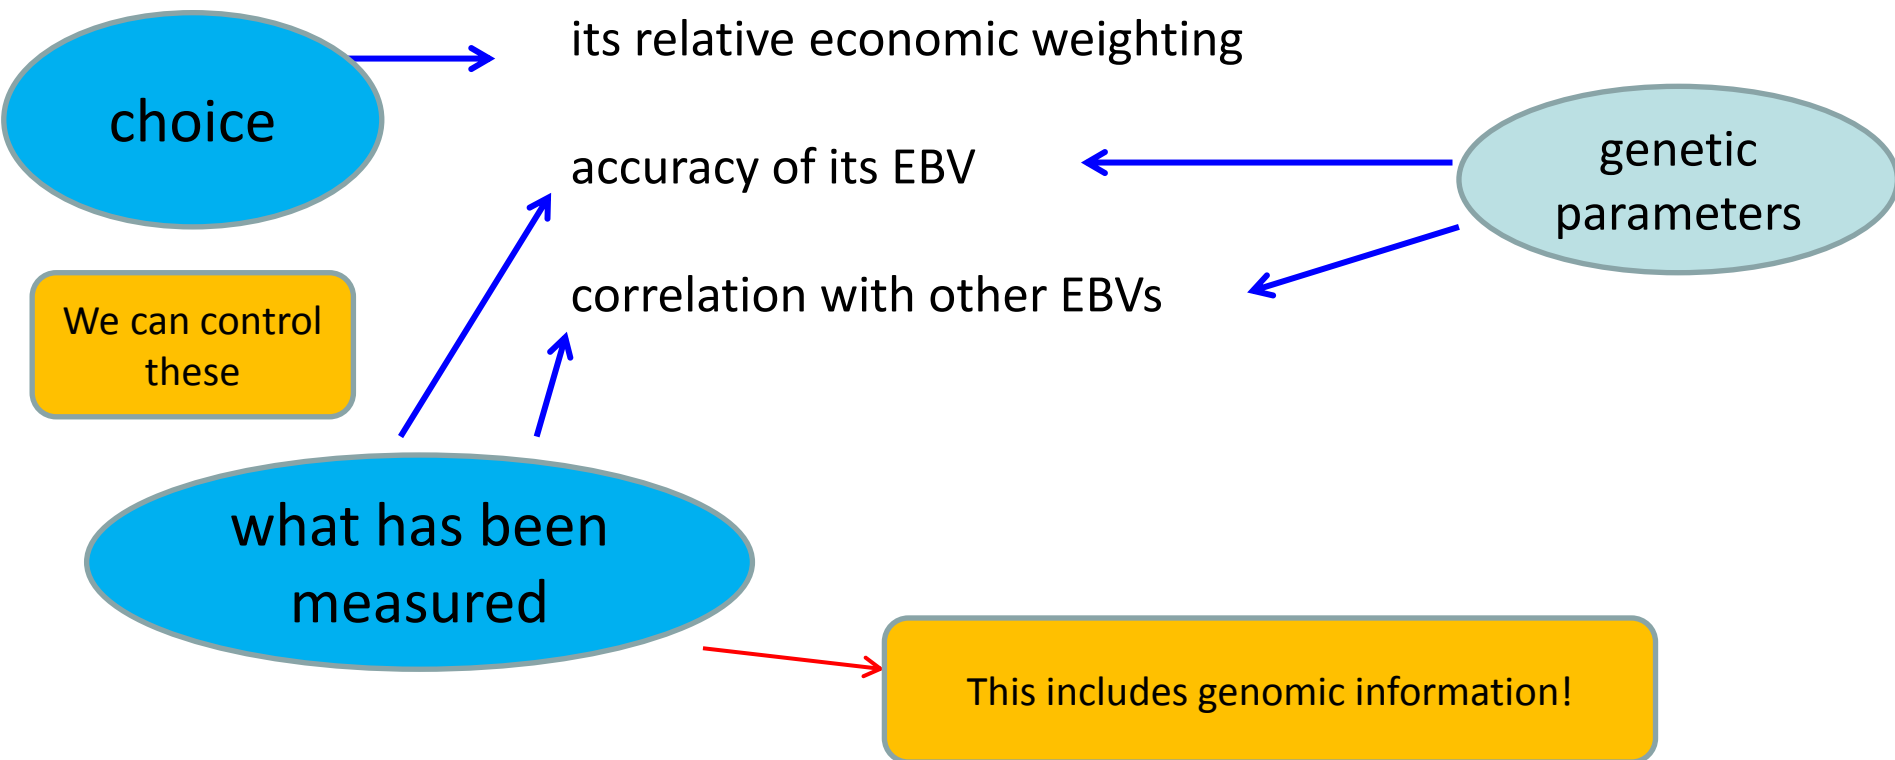

Reprod technol. In a breeding design context

Effect of Measurement

Some important points about MT selection

1 The ultimate response of a trait will depend on:

Selection for milk Yield and Feed Intake

| <i>economic</i> | <i>weights</i> | <i>progeny</i> | <i>measured</i> | <i>response</i> | <i>(4 yrs)</i> |
|-----------------|----------------|----------------|-----------------|-----------------|----------------|
| <i>milk</i> | <i>feed</i> | <i>milk</i> | <i>feed</i> | <i>milk</i> | <i>feed</i> |
| 0.2 | 0 | 50 | - | 1.23 | 0.56 |
| 0.2 | 0 | 50 | 50 | 1.23 | 0.59 |
| 0.2 | -0.2 | 50 | - | 1.23 | 0.56 |
| 0.2 | -0.2 | 50 | 50 | 0.97 | 0.16 |
| 0.2 | -0.3 | 50 | - | 1.23 | 0.56 |
| 0.2 | -0.3 | 50 | 50 | 0.52 | -0.20 |
| 0.2 | -0.3 | 50 | 10 | 0.79 | 0.14 |

To achieve response for a trait, we need to give it some weight
but we also need some data!

Decision Support

Tools

Where to go?

BreedObject, Indexes

Who and what to measure?

Not much

Who to select and mate?

EBVs, Indexes, TGRM

Tactical Decisions

vs

Strategic Decisions → Prediction and Simulation models

Optimizing Phenotyping

Cécile Massault, Brian Kinghorn and Julius van der Werf

Maximize the accuracy of selection candidates (offspring)

We have \$\$ for 15 phenotypes, who?

| | Structure | # GP | # sires | # dams | # offspring | Family size | | |
|------|-----------|------|---------|--------|-------------|-------------|----|----|
| PED1 | HS | 66 | 3 | 30 | 30 | 10 | 10 | 10 |
| PED2 | FS | 12 | 3 | 3 | 30 | 10 | 10 | 10 |
| PED3 | HS | 66 | 3 | 30 | 30 | 2 | 10 | 18 |
